2021-02-26

Withdrawal of SMPTE RP 210 and SMPTE RP 224

A document should be Withdrawn only if there is a significant possibility of its use causing harm. A Withdrawn document shall still be made available and offered for sale by the Society, but it shall be prefaced by a cover page explaining its current status including a statement that some or all of the content is no longer endorsed by the Society

SMPTE RP 210[1] and SMPTE RP 224[2] were previously used to publish the contents of the SMPTE Element and Label metadata registers, respectively. They were last revised in 2012.

Since then, the SMPTE metadata registers have substantially evolved:

- entries have been added and modified;
- a data model and interchange format has been formalized for all SMPTE metadata registers; and
- all SMPTE metadata registers are now published as elements of a single document (SMPTE ST 2123) using the formal interchange format.

As a result, SMPTE RP 210 and SMPTE RP 224 contain out-of-date information which is likely to harm interoperability.

SMPTE RP 210 and SMPTE RP 224 should therefore be withdrawn.

Implementers, users, and documentation should instead refer to SMPTE ST 2123.

Foreword

SMPTE (the Society of Motion Picture and Television Engineers) is an internationally-recognized standards developing organization. Headquartered and incorporated in the United States of America, SMPTE has members in over 80 countries on six continents. SMPTE's Engineering Documents, including Standards, Recommended Practices, and Engineering Guidelines, are prepared by SMPTE's Technology Committees. Participation in these Committees is open to all with a bona fide interest in their work. SMPTE cooperates closely with other standards-developing organizations, including ISO, IEC and ITU.

SMPTE Engineering Documents are drafted in accordance with the rules given in Part XIII of its Administrative Practices.

SMPTE RP 224v12:2012 was prepared by Technology Committee 30MR.

Intellectual Property

At the time of publication no notice had been received by SMPTE claiming patent rights essential to the implementation of this Recommended Practice. However, attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. SMPTE shall not be held responsible for identifying any such patent rights.

1 Scope

The SMPTE labels register defined by this practice covers the use of SMPTE universal labels as individual items where the meaning of each label is conveyed by the content of the universal label alone. A full definition is given in SMPTE ST 400.

The labels register structure defined in SMPTE ST 400 covers the use of SMPTE universal labels for identification all types of essence (video, audio, and data in their various forms) and metadata. The standard specifies that any application must conform both to:

(a) the definitions and formats in SMPTE ST 400; and

(b) this SMPTE labels register practice.

The standard and this practice shall be used together as a pair; neither may be used in isolation. This practice contains a representation of the SMPTE labels register contents in the form of an excel spreadsheet. Other representations may be made available as defined by SMPTE ST 400.

2 Conformance Notation

Normative text is text that describes elements of the design that are indispensable or contains the conformance language keywords: "shall", "should", or "may". Informative text is text that is potentially helpful to the user, but not indispensable, and can be removed, changed, or added editorially without affecting interoperability. Informative text does not contain any conformance keywords.

All text in this document is, by default, normative, except: the Introduction, any section explicitly labeled as "Informative" or individual paragraphs that start with "Note:"

The keywords "shall" and "shall not" indicate requirements strictly to be followed in order to conform to the document and from which no deviation is permitted.

The keywords, "should" and "should not" indicate that, among several possibilities, one is recommended as particularly suitable, without mentioning or excluding others; or that a certain course of action is preferred but not necessarily required; or that (in the negative form) a certain possibility or course of action is deprecated but not prohibited.

The keywords "may" and "need not" indicate courses of action permissible within the limits of the document.

The keyword “reserved” indicates a provision that is not defined at this time, shall not be used, and may be defined in the future. The keyword “forbidden” indicates “reserved” and in addition indicates that the provision will never be defined in the future.

A conformant implementation according to this document is one that includes all mandatory provisions ("shall") and, if implemented, all recommended provisions ("should") as described. A conformant implementation need not implement optional provisions ("may") and need not implement them as described.

Unless otherwise specified, the order of precedence of the types of normative information in this document shall be as follows: Normative prose shall be the authoritative definition; Tables shall be next; followed by formal languages; then figures; and then any other language forms.

3 Normative References

Note: All references in this document to other SMPTE documents use the current numbering style (e.g. SMPTE ST 400:2004) although, during a transitional phase, the document as published (printed or PDF) may bear an older designation (such as SMPTE 400M-2004). Documents with the same root number (e.g. 400) and publication year (e.g. 2004) are functionally identical.
The following standard contains provisions which, through reference in this text, constitute provisions of this recommended practice. At the time of publication, the edition indicated was valid. All standards are subject to revision, and parties to agreements based on this recommended practice are encouraged to investigate the possibility of applying the most recent edition of the standard indicated below.

SMPTE ST 400:2004, Television — SMPTE Labels Structure

4 Register Structure

The structure of this register shall comply with the provisions of SMPTE ST 400.

For convenience of the management of the registry, SMPTE labels are organised under the six distinct classes of identification: administration, interpretation, parametric, process, relational, spatio-temporal and compound as defined by SMPTE ST 400. Two further classes are reserved for organizationally registered metadata and one for experimental use.

These classes, and all sub-classes therein, are identified as nodes. All nodes have an assigned SMPTE label value and, per SMPTE ST 400, all nodes are reserved for navigation and management purposes only.

5 Register Implementation

The first two rows of the register shall identify each column of the register as defined by SMPTE ST 400.

The register may include an additional column that identifies the register version of each entry for reader clarity. This version number shall be identical to the last byte of the Registry Designator.

Annex A Bibliography (Informative)

Note: All references in this document to other SMPTE documents use the current numbering style (e.g. SMPTE ST 298:2009) although, during a transitional phase, the document as published (printed or PDF) may bear an older designation (such as SMPTE 298-2009). Documents with the same root number (e.g. 298) and publication year (e.g. 2009) are functionally identical.
